# JAVA Fundamentals

Variables: Challenge

---

## IdBadge

You have learned how different types of variables hold different types of data: String, int, double, etc. Your task is to a program called IdBadge that assigns values to several variables, then uses those variables to display the info like an ID Badge.

## Procedure

### Declare your variables

1. You will need to display the name, job title, and employee # for the badge.
2. Determine what identifier or word you will use for each variable.
3. Determine what type of data is required for each.

### Assign and display your values

4. Give your variables some made up information about an employee.
  5. Use several println() methods to display your information like an ID Badge.
